

Network Management

For 23 years Applied Systems has been managing networks for customers around the United States. Companies of every size look to outsource some or all of their IT needs to contain costs and ensure that only highly trained personnel are working on their networks. Applied Systems will work with you within your needs to help you maintain a stable and secure network.

We manage your network, so you can manage your business.

Complete IT outsourcing – Many companies look to Applied Systems by outsourcing their complete IT needs to us. As their full service IT department, we can help them contain costs.

Preventive Maintenance – You get the oil changed on your car. You you’re your mechanics clean and maintain the tools they use. Maintenance on a computer network is no different; computers, and especially servers, require periodic maintenance to ensure they operate at peak performance for an extended time.

Unscheduled Maintenance – Even with a solid design and consistent maintenance, issues with your network might still occur. We can provide maintenance remotely from our facility saving you money and fixing the problem quickly, or our staff of techs can be at your facility within hours to fix a problem.

Data Security – Losing access to or completely losing the corporate data will cripple many of today’s businesses since they are built around their database of customers. Applied Systems can help you manage the security of your database of customers through consistent updating of patches, virus and malware definitions, and designing a secure network with solid backups.

Network Monitoring – Our facilities enable us to monitor most equipment in your network to ensure that they are operating at the peak of their efficiency, ensuring your network provides you the performance and security you require to be successful.
